SACRUM / CORDATA

Investor Presentation Script

A simple spoken script for the five finance slides

Perspective: show why investing could be attractive, how capital supports growth, and why a value-add investor is wanted. Do not promise a return.

Prepared for a soft-skills investor-pitch exercise

All financial figures are illustrative classroom assumptions, not verified company results.

Before presenting

Aim for about six minutes, speak in your own voice, and do not read every chart label. Use the exact numbers shown in the deck. Pause after the customer result and after the funding ask.

- The case is fictional / illustrative for the training activity. Speak as the founders of the case company, but do not claim a guaranteed investor result.
- Use “savings-to-fee ratio,” not “guaranteed ROI.” The model does not provide an investment valuation or equity percentage.
- If someone asks about a number not on the slide, state the assumption and offer how you would verify it rather than inventing an answer.

Opening — about 20 seconds

“Good morning, and thank you for your time. Sacrum helps organizations manage complex cloud environments through expert services and Cordata, our cloud governance platform. We are raising INR 25 crore to grow the product and expand our ability to serve larger enterprise and public-sector customers. I’ll show our traction, the customer value, how the plan is built, and what your investment would help us achieve.”

Slide 1 — Growth and traction | about 50 seconds

“We started with cloud consulting because the founders already understood the problems customers faced across AWS, Azure and private cloud. In this case history, recognized revenue grows from INR 0.44 crore in CY22 to INR 32 crore in CY25. Customers grow from four to 120. The stacked bars separate services from Cordata so you can see both the scale of the business and the start of a platform mix. We also raised INR 75 lakh from angels, alongside INR 18 lakh of founder capital. Our lesson from the early years is that services built trust and brought us close to customer problems.”

Point to the bars as you say “services” and “Cordata”; avoid reciting every year. State that these are case-history numbers for the activity.

Transition

“The next question is whether our platform can become a larger and more repeatable part of the business.”

Slide 2 — Revenue quality | about 55 seconds

“Cordata is designed to turn repeated consulting insight into software that can serve more customers. In the case history, Cordata rises from 9% of recognized revenue in CY22 to 35% in CY25. Recognized revenue is what the model assigns to the year; exit ARR is the annualized recurring run rate at the year end. They are different measures, so we show them separately. The margin line is an assumption in this exercise: Cordata is modeled at a higher gross margin than services. If the mix shifts toward software, blended margin could improve, but we would need to keep product quality and customer retention high.”

Point at the 100% bars for mix, then the line for margin. Do not say ARR is the same as annual revenue.

Transition

“That product mix only matters if it solves a real problem for customers. Here is one example.”

Slide 3 — Customer value | about 60 seconds

"One automotive components customer had limited visibility into cloud use and spend across AWS and Azure. Sacrum delivered an assessment and optimization project, then piloted Cordata. In this illustrative case, the customer reports INR 32 lakh in annual savings, 18% lower cloud spend, more than 200 idle resources removed and 75% less monthly reporting effort. The annual Cordata fee is INR 6 lakh, so reported annual savings are about 5.3 times the subscription fee. The first year includes INR 12 lakh for consulting plus the INR 6 lakh subscription. Assuming savings accrue evenly, that first-year spend is recovered in about seven months. We use this to show customer value, not to promise that every customer will get the same result."

Let the audience see the comparison. Say "savings relative to fee" so it is clear this is a ratio, not an investor return.

Transition

"Now I'll show how we translate our growth plan into customer, sales and revenue drivers."

Slide 4 — Forecast and operating plan | about 75 seconds

"Our forecast starts from INR 32 crore of CY25 revenue. Each year, we subtract expected revenue churn, add expansion from existing customers, then add revenue from new logos, PSU work and international accounts. For CY26, the example assumes 8% revenue churn, 18% expansion, 40 new enterprise logos at INR 35 lakh of full-year revenue equivalent per logo, and INR 2 crore in PSU revenue. That produces about INR 51 crore. The following years use higher logo targets and a larger Cordata mix, reaching about INR 89 crore and then INR 147 crore. This is an ambitious plan: the model assumes 25% win rates, 8 wins per sales representative, and a growing qualified pipeline. These are assumptions we would track against actual results. The new-logo revenue is treated as a full-year equivalent in this classroom model; timing could reduce recognized revenue if deals close late."

Trace one step through the waterfall, then point to the operating table. Make clear the forecast is a scenario rather than a promise.

Transition

"To pursue that plan sooner, we are asking for capital that lets us invest ahead of revenue."

Slide 5 — The ask and the investor case | about 75 seconds

"We are seeking INR 25 crore for a planned 24-month expansion. Forty percent, or INR 10 crore, goes to product engineering; 30%, or INR 7.5 crore, to sales expansion; 20%, or INR 5 crore, to customer success; and 10%, or INR 2.5 crore, to working capital. The milestones are AI recommendations, teams in three Indian cities, predictive governance and FinOps automation, and stronger support for larger customers. We model EBITDA staying positive but falling close to break-even in CY27 while we invest. That makes execution and cash discipline important. The working-capital reserve reflects longer collection times; the model assumes about 110 days for PSU receivables."

Investor-facing close

"We want an investor who brings more than capital: experience in enterprise software, hiring, customer introductions, public-sector procurement or international expansion would help us execute faster. The potential benefit to you is participation in the company's future value if the plan succeeds, through the ownership terms we agree together. The exact valuation and equity percentage are not set in this exercise, and there is no guaranteed return. We would value a partner who can challenge the plan, open the right doors and help us build a durable platform business. Thank you. I'm happy to take your questions."

Optional shorter closing

"We are not raising because the current business has no value; we are raising because product, sales reach and customer support are the constraints on a bigger opportunity. Your capital can help us expand Cordata faster, and your experience can make that expansion more effective. If we execute, you may share in the value we create. We would like you as a thoughtful partner in that journey."

Delivery tips

- Make eye contact when describing the customer problem and when stating the ask.
- Use the chart as a prompt; do not narrate every point or read the whole table.
- Slow down for the INR 25 Cr allocation. Give the audience a moment to absorb each amount.
- Own the assumptions. Say "our model assumes" and explain what evidence would prove or disprove the assumption.
- If asked about returns, valuation or equity, say those terms are not defined here and would be negotiated. Do not make up a multiple or promise liquidity.
- End with a specific invitation: ask whether the investor would consider a follow-up discussion on product milestones, go-to-market or funding structure.

Memory card

Slide	One line to remember
1	Services opened doors; the case history shows customers and revenue growing.
2	Cordata's share grows; recurring run rate and recognized revenue are different.
3	The customer example links the product to measurable savings.
4	Revenue growth comes from retention, expansion, new logos and PSU / international sales.
5	INR 25 Cr funds a 24-month plan; the investor brings capital and strategic help, with uncertain upside.
